Backhaul Brilliance

Business Broadband Connectivity

**Fiber performance or
wireless flexibility? Have both**

Rolling out new business broadband services? Do it faster than anyone else. And how about fiber performance, but not the cost, and definitely not the inflexibility? In the old wireless world you were limited in capacity and spectrum was often congested or expensive.

Now you can get Gigabit throughput over interference-free uncongested millimeter wave spectrum, at an unbeatable price/megabit. There isn't a better way to deliver broadband services to multiple customers over the last mile, which is why our wireless radios are bestsellers worldwide.

10x Spectrum

Find available frequency easily, even in dense urban areas, using uncongested, interference-free 70/80 GHz bands.

4x Capacity

Future-proof capacity with full Gigabit links, and roll out broadband services to multiple customers on a single link.

2x Reliability

With carrier grade reliability and over 90 years MTBF, your truck rolls and maintenance are about to get minimal.

1/3x Time to Deploy

Deploy fast with quick licensing for the E-band spectrum; simple site acquisition; and an easy as Wi-Fi installation.

Uncompromising Performance, Minimal Cost.

Deliver carrier grade performance with fiber-like minimal jitter and delay all the way to your customer, with a fast ROI!

- EtherHaul radios are based on an all-silicon design that results in fewer components, greater reliability, and significant price reductions.
- Reduce deployment costs on the E-band spectrum with low licensing fees and a quick licensing process. The spectrum is interference-free so site acquisition is quicker.
- Equipment investment is flexible, the small radio can be easily moved to a new location.

EtherHaul-1200/TL

E-Band Radio

Up to 1 Gigabit aggregated throughput with asymmetric upload/download rates (TDD)

EtherHaul-1200FX

E-Band Radio

1 Gigabit throughput full duplex (FDD)

How will you extend your business broadband delivery network?

About Siklu

Siklu delivers Gigabit capacity millimeter wave wireless backhaul solutions operating in the 60, 70 and 80 GHz bands, ideal for dense, capacity-hungry urban wireless broadband networks. The most deployed millimeter wave radios in the world, thousands of units are delivering carrier grade performance in varying weather conditions around the world.
